🔥 FIREWISE-X — 240-Second Local Judging Presentation

Mymensingh Local Judging ("240 Seconds of Glory") | Flame in Freefall

Target Duration: 240 Seconds (4:00 Minutes)

Submission Slot: 13 Nov 18:30–19:00 (Google Drive Upload)

Team: Unobtanium, Mymensingh

Live Codebase: http://localhost:3000

🎬 **Presentation Blueprint (Exact 4:00 Minutes):** Demonstrate how FIREWISE-X audits real NASA combustion science. Includes clicks, reading pauses, exact table locators, condition contrasts, and honest scientific abstention.

TIMECODE	VISUAL SCREEN ACTION (WHAT TO CLICK & SHOW)	ENGLISH NARRATION DRAFT (SPOKEN VOICEOVER)
0:00 – 0:20 (20s)	**Team, Challenge & B1 Research Question** Show FIREWISE-X Home page banner, team name Unobtanium, Mymensingh. Pose B1 research question clearly.	"We're Unobtanium from Mymensingh. We built FIREWISE-X for Flame in Freefall. What happened to a thin PMMA film flame when airflow stopped in NASA's BASS-II experiment?" *Pacing: Energetic, formal, scientific introduction.*
0:20 – 0:55 (35s)	**PSI-25 -> B1 Metadata & Table A.1 Link** Navigate to Test B1 (sample 147). Show fuel (100 µm PMMA), geometry, opposed flow. Click link opening NASA/TM Table A.1.	"We start with test B1. The experiment used a thin PMMA film and opposed flow. This link opens Table A.1 in the NASA memorandum so a reviewer can verify the original observation." *Pacing: Steady, demonstrating clickable provenance.*
0:55 – 1:35 (40s)	**Report Row, Verified Clip & HUD Mask** Open Flame Studio. Play verified B1 clip. Highlight active Chamber HUD Mask (excluding OSD clock). Show extinction event.	"The report describes flame spread followed by rapid visible flame extinction after airflow stopped. The video gives the visual context. Where we have a verified event label, we show the frame and its timing basis." *Pacing: Measured, showing video sync and HUD filtering.*

TIMECODE	VISUAL SCREEN ACTION (WHAT TO CLICK & SHOW)	ENGLISH NARRATION DRAFT (SPOKEN VOICEOVER)
1:35 – 2:15 (40s)	**Ranked Answer & Condition Contrast** In 129 Tests Explorer, show B1 direct match. Compare against a related run with different thickness or flow. Highlight matching fields.	"For this question, the direct B1 record ranks first. The related run differs in material or flow direction. Its evidence adds context. You can see why it appears here and open its original source." *Pacing: Demonstrating condition-aware ranking.*
2:15 – 2:55 (40s)	**O13a Endpoints (Glovebox) & Lunar Abstention** In Mission Control, select O13a. Point out verified 389 → 950 ppm glovebox endpoints. Search 'lunar' in Evidence Engine: show Abstention card!	"O13a recorded 389 and 950 parts per million before and after the test in the glovebox. A timed spike or crew exposure would require other measurements. For a lunar partial-gravity question, the dashboard explains the evidence gap." *Pacing: Emphasizing rigorous scientific honesty.*
2:55 – 3:35 (40s)	**Pinned Build, Source Version & Truthful Export** Show PSI-25 DOI, exact 129 row manifest, and click 'Export Run CSV' displaying provenance headers and interpolation labels.	"Open the same build and use the query on screen. The evidence package includes the dataset version, source locator and evaluation cases. The results panel shows the observed counts, including cases where the system withheld an answer." *Pacing: Confident technical closure.*
3:35 – 4:00 (25s)	**Live Demo Verification & Final End Card** Show live URL (http://localhost:3000), source citations, team members. Hold final end card for 5–7 seconds.	"FIREWISE-X gives reviewers a path from a fire-safety question to a NASA observation and its conditions. Try the B1 query and verify the same result in the report. Thank you." *Pacing: Strong conclusion; hold end card silently.*
